

10. Working with text

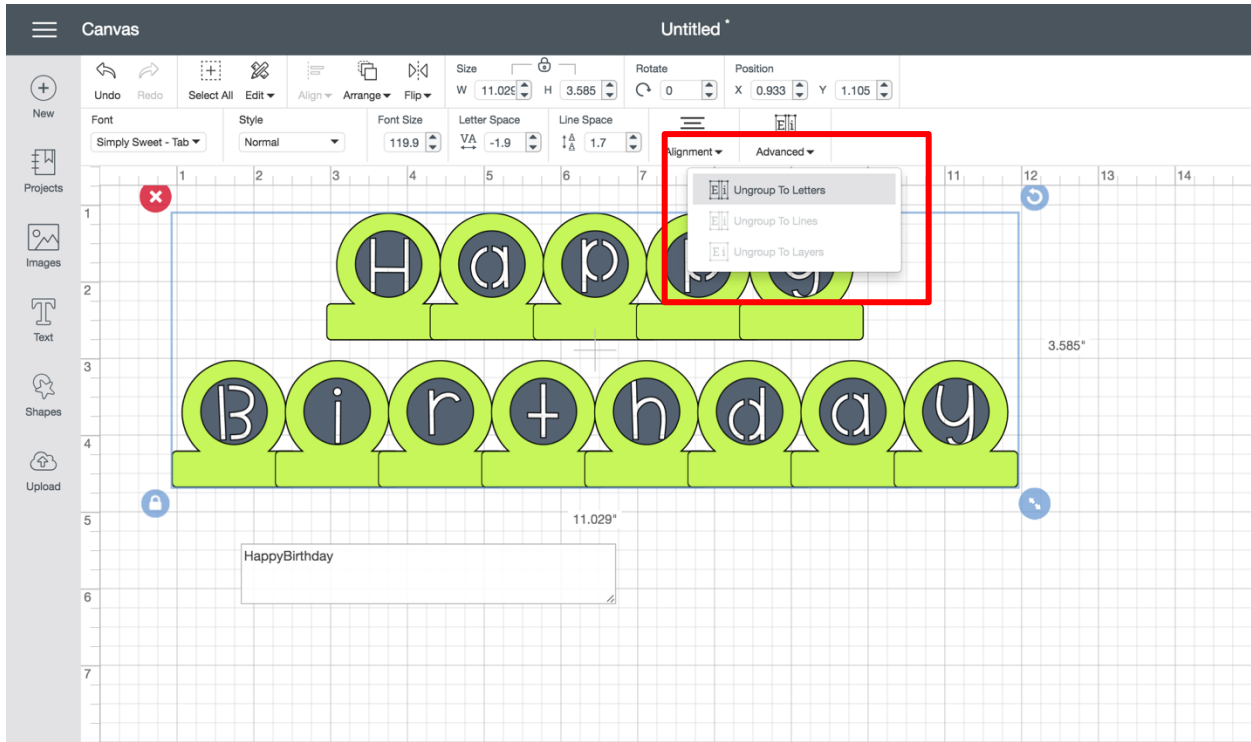

H. Ungroup to Letters

Refine the design of your project by separating the letters of multilayered text. This makes it easy to rotate, resize, color, or delete individual letters without impacting the others.

Step 1 Click on the solid portion of text to select it. The Bounding Box will appear around the text.

Step 2 Click *Ungroup to Letters* in the Edit Bar. The letters of the group are separated and converted to an image, but the layers of each letter will remain grouped.

Step 3 In the Layers Panel, the letters are still grouped with their layers. The letters, each with all their layers, now can be moved, sized, and rotated separately.
